F192029

Reg No.:

B

Name:

APJ ABDUL KALAM TECHNOLOGICAL UNIVERSIT SIXTH SEMESTER B.TECH DEGREE EXAMINATION(S), DECEMBER 201

Course Code: CS304

Course Name: COMPILER DESIGN

Max. Marks: 100

Duration: 3 Hours

Marks

PART A Answer all questions, each carries3 marks.

- 1 Scanning of source code in compilers can be speeded up using input buffering. (3) Explain. 2 Draw the DFA for the regular expression $(a | b)^* (abb | a+b)$. (3) 3 Differentiate leftmost derivation and rightmost derivation. Show an example for (3)each. (3)
- 4 Find out context free language for the grammar given below:
 - $S \rightarrow abB$ $A \rightarrow aaBb | \varepsilon$ B->bbAa

PART B

Answer any two full questions, each carries9 marks.

5	a)	Explain compiler writing tools.	(5)
	b)	Given a grammar :	
		$S \rightarrow (L) a$	
		$L \rightarrow L, S \mid S$	
		(i) Is the grammar ambiguous? Justify	
		(ii) Give the parse tree for the string (a,((a,a), (a,a)))	
6	a)	Construct the predictive parsing table for the following grammar:	(5)
		$S \rightarrow (L) a$ L -> L,S S	
	b)	Explain how the regular expressions and finite state automata are used for the	(4)
		specification and recognition of tokens?	
7	a)	Explain the working of different phases of a compiler. Illustrate with a source	(5)
		language statement.	
	b)	Can recursive descent parsers used for left recursive grammars? Justify your	(4)
		answer. Give the steps in elimination of left recursion in a grammar.

Pages:2

PART C

Answer al.	questions,	each carries3	marks.
------------	------------	---------------	--------

	Compute FIRST and FOLLOW for the grammar:	(3)
	$S \rightarrow SS + SS^* a$	
	Write the algorithm to construct LR(1) collection for a grammar.	(3)
	What is an SDD? Show an example.	(3)
	Distinguish between synthesized and inherited attributes.	(3)
	PART D	
a)	Answer any two full questions, each carries9 marks. Write algorithm for SLR paring table construction.	(5)
b)	Construct syntax directed translation scheme for infix to postfix translation.	(4)
		ā.:
a)	Construct the SLR table for the grammar:	(5)
	S -> aSbS a	
b)	Give the annotated parse tree for the expression: $1*2*3*(4+5)$ n	(4)
a)	Differentiate CLR and LALR parsers.	(4)
b)	Explain the specification of a simple type checker.	(5)
	PART E	
0)	Answer any four full questions, each carries10 marks.	
a) b)	Explain now DAGs help in intermediate code generation?	(4)
b)	Explain the code generation algorithm. Illustrate with an example.	(6)
a)	Define the following and show an example for each.	(6)
	i). Three-address code iii). Triples	
b)	State the issues in design of a code generator	(A)
a)	Explain different stack allocation strategies with suitable examples	(\mathbf{T})
a)	Explain different code optimization techniques available in local and global	(10)
	optimizations?	(10)
a)	How is storage organization and management done during runtime?	(4)
b)	How the optimization of basic blocks is done by a compiler?	(6)
a)	Write the algorithm for partitioning a sequence of three-address instructions into	(4)
	basic blocks.	
	 a) b) b) a) b) b) b) c) <	 Compute FIRST and FOLLOW for the grammar: S -> SS+ SS* a Write the algorithm to construct LR(1) collection for a grammar. What is an SDD? Show an example. Distinguish between synthesized and inherited attributes. PART D Answer any two full questions, each carries9 marks. a) Write algorithm for SLR paring table construction. b) Construct syntax directed translation scheme for infix to postfix translation. a) Construct the SLR table for the grammar: S -> aSbS a b) Give the annotated parse tree for the expression: 1*2*3*(4+5) n a) Differentiate CLR and LALR parsers. b) Explain the specification of a simple type checker. PART E Answer any four full questions, each carries10 marks. a) Explain the code generation algorithm. Illustrate with an example. a) Define the following and show an example for each. i). Three-address code iii). Triples ii). Quadruples iv). Indirect triples b) State the issues in design of a code generator. a) Explain different stack allocation strategies with suitable examples. a) Explain different stack allocation strategies with suitable in local and global optimizations? b) How the optimization of basic blocks is done by a compiler? a) How is storage organization and management done during runtime? b) How the optimization of basic blocks is done by a compiler? a) Write the algorithm for partitioning a sequence of three-address instructions into basic blocks.
